Evolutionary psychology is an important and rapidly expanding area in the life, social, and behavioral sciences, and this Handbook represents the most comprehensive and up-to-date reference text in the field today. Chapters in Social Psychology and Evolutionary Psychiatry explore some of the central evolutionary concepts that may have evolved in human identity and action, and the evolutionary origins and neural underpinnings of such behavior. This book is for anyone interested in the evolutionary origins, neural underpinnings, and psychological structure involved in human relationships.

The topics will emphasize human reproduction, and fertility-related behavior in particular, and a wide range of mental health professionals. Specific topics addressed include the nature of evolved mental mechanisms; regulation/dysregulation of internal processes; attachment and bonding systems; and the roles of shame and guilt in treatment. Providing up-to-date summaries of recent thinking in this increasing important but diverse area, Genes on the Couch will be of interest to psychotherapists, psychiatrists, and a wide range of mental health professionals.

In this ground-breaking book, Aristotelian and evolutionary understandings of human social nature are brought together to provide an integrative, psychological account of human ethics. The book emphasizes the profound ways in which human social nature is the consequence of evolutionary processes and how these processes have shaped our present understanding of human sociality.

The Handbook is designed for advanced undergraduates, graduates, and professionals in psychology, anthropology, biology, sociology, and demography, as well as many other social and life science disciplines. It is the first resource of its kind that brings together empirical and theoretical contributions from scholarship at the intersection of evolutionary psychology and parenting. Each of the authors has a Ph.D. in psychology or a related field covering state-of-the-art research. The Oxford Handbook of Evolutionary Psychology and Parenting provides a comprehensive resource for state-of-the-art research on how our evolutionary past informs current parenting roles and practices. Featuring chapters by noted scholars, this three-volume set addresses how the role of spirituality and its constructive expressions in various religions—and outside of formal religion—enhances human personality and experience. 55 distinguished contributors represent a broad range of disciplines, including psychology, religion, neuroscience, evolutionary biology, and more. The three volumes cover topics such as evolutionary biology and parental behavior, evolutionary influences on children's cognitive development, and the evolutionary basis of parenting. The series offers a unique perspective on the intersection of evolutionary biology and modern parenting, making it a valuable resource for students, researchers, and professionals interested in understanding the evolutionary foundations of parenting.
